

CURRICULUM VITAE
AANAND D. NAIK, MD

Research Focus and Thematic Areas

My research focuses on the concept of patient-centeredness, how to characterize it as a dimension of health care quality, and its integration into learning health systems. Our research uses basic social, behavioral, and systems (sociomedical) sciences to model patient-centeredness and describes how patients and clinicians communicate, arrive at decisions, and act on those decisions within the individual clinical encounter and the broader learning health system. Our descriptive research is then translated into proscriptive interventions to improve health outcomes for older adults with multiple morbid conditions. To accomplish this overarching objective, my research program spans the following thematic areas:

1. Articulation of patient-defined goals, effective communication of those goals in patient-clinician encounters, and testing intervention models in chronic care (Principal Investigator Research Portfolio). Qualitative and survey studies refined our conceptual model and provided the scaffolding for designing interventions. These studies have identified a method for eliciting patient values and goals and translating goals aligned care as a guide for clinical decision making and treatment plans. We are currently testing these interventions in clinical trials.
2. Understanding older patients' experiences and the impact of these experiences on care coordination and outcomes. (Principal/Team Science Research Portfolio). Through the lens of dementia care and cancer treatment and survivorship, we explore the patient experiences of older multimorbid adults. These studies use systematic reviews and qualitative and survey methods with patients and clinicians to further develop our model of patient centeredness grounded in patient, clinician, and healthcare teams experiences with care.
3. Using patient-centered, comparative effectiveness data to develop (sociomedical) models of care coordination and adherence to best practices. (Co-Investigator/Team Science Research Portfolio). These studies use cognitive interviews, behavioral economic methods, and secondary database studies to understand provider behavior in the management and outcomes of multimorbid older adults.
4. Validation and dissemination of tools to evaluate vulnerable older adults' capacity to make and execute decisions for safe and independent living. (Enduring Educational Products Portfolio). These studies focused on the most vulnerable of older multimorbid adults and explored shared decision making within the context of self-neglect and adults with impairments in functional and decision making abilities.
5. Development of the human capital for an interdisciplinary, learning health system research enterprise; consisting of basic social, organizational and behavioral scientists working on applied problems in health care with clinicians trained in health services and patient-centered outcomes research. (Educational Leadership Portfolio). This program reflects my leadership of education and training programs of graduate and postdoctoral fellows focused on health services research and scholarship in quality improvement and patient safety.
